

# COMPOSTING WITH A PURPOSE: BIO FUMIGATION PROTOCOL

## 1 Brew 5 gallons of garden tea

UFI Recipe for Compost Tea- It can be found on our YouTube Channel or see UFI Compost Tea Protocol

1

2

## 2 Collect Brassica leaves

Collect brassica leaves, some of the most common plants are arugula, bok choy, mustard, broccoli, cabbage, cauliflower, collard, and more

## 3 Break up accumulated leaves

Using a law mower or high powered shredding machine break up the leaves of the plants and spread them liberally around your garden medium.

3

4

## 4 Work into the soil

Work these shredded leaves into the garden soil to a depth of about 10 inches or as deep as practical

5

## 5 Apply liberal amounts of garden tea

Apply liberal amounts of garden tea using UFI's recipe. The tea will activate the chemistry of the Brassica leaves and begin creating a natural resistance to pests

# WHY USE BIOFUMIGATION?

WANT TO  
REDUCE  
PESKY LITTLE  
BUGS IN YOUR  
GARDEN?

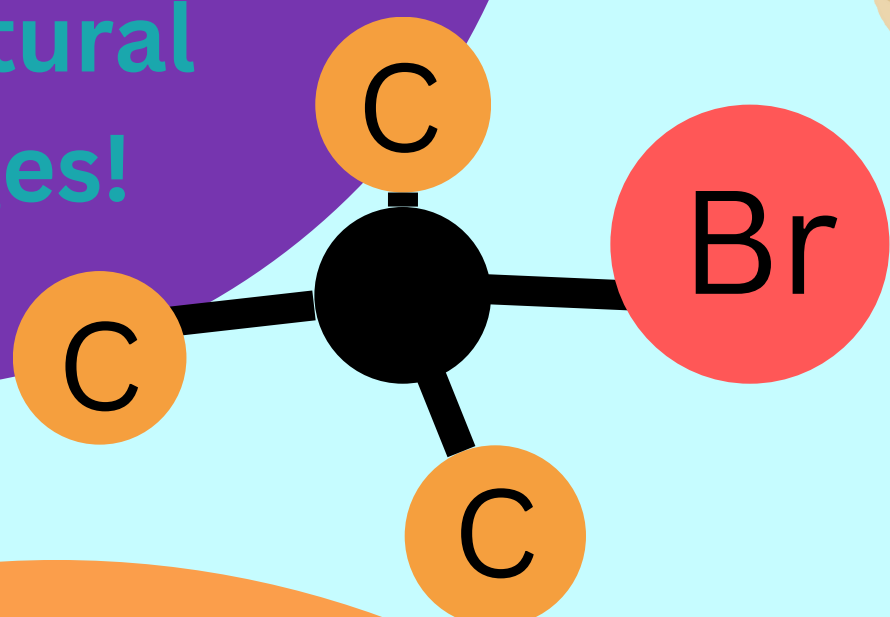

There is a **NATURAL** way to boost your garden defenses against nasty pests such as nematodes, insects, weeds and other pathogens!!

Methyl Bromide is a toxic ozone depleting gas, and at one time it was used as a soil fumigant for a host of agricultural challenges!

## BRASSICA FAMILY

**BANNED IN USA  
JAN 1ST 1989**

Years ago the great state of Maine, well known for growing tasty potatoes, began growing broccoli as another important agricultural crop. Potato farmers would trade acreage with broccoli farmers. After sometime, it was discovered once the broccoli was harvested and tilled into the fields a greater potato harvest would follow with better, heavier, better tasting potatoes. The question then became **WHY?**

Turns out, after carefully directed research by the USDA Agricultural Research Service it was discovered that decomposing broccoli leaves give off a gas functionally very similar to Methyl Bromide. Thus the soil had been fumigated and was cleaned of many soil borne pests, diseases and weeds!
